CHARACTERISTICS

These vane pumps have been specially designed for high/low circuits. The combination of different cartridges in double and triple pumps allows low flow at high pressure (300 bar max.) and high flow at lower pressure. This is a clever way to optimize your circuit design. This pump feature will also allow a very fast pressure cycle change with a very precise flow repeatability.

GREATER FLOW

Size A : 5.8 to 40.0 ml/rev.
Size B : 5.8 to 50.0 ml/rev.
Size C : 10.8 to 100.0 ml/rev.
Size D : 44.0 to 158.0 ml/rev.
Size E : 132.3 to 268.7 ml/rev.

HIGHER PRESSURE

A : up to 300 bar max.
B : up to 320 bar max. (300 bar for multiple pump).
C : up to 275 bar max.
D : up to 280 bar max. (250 bar for multiple pump).
E : up to 240 bar max.

WIDE SPEED RANGE

Industrial pumps : Min. : 600 RPM - Max. up to 3600 RPM

BETTER EFFICIENCY

Increases productivity, reduces heating and reduces operation costs.

LOW NOISE LEVELS

Increases operator safety and eases machines acceptances.

MOUNTING FLEXIBILITY

Single pumps : 4 different positions.
Double pumps : 32 different positions.
Triple pumps : 128 different positions.

CARTRIDGE DESIGN

Provides for drop-in assemblies. They permit easy conversion and service.
A, B and D cartridges : bi-directional technology.
C and E cartridges : uni-directional technology.

WIDE RANGE OF ACCEPTABLE VISCOSITIES

Viscosities from 860 to 10 cSt permit colder starts and hotter running. The balanced design compensates for wear and temperature changes. At high viscosity or cold temperature, the rotor to side plates gap is well lubricated and improves mechanical efficiency.

FIRE RESISTANT FLUIDS AND BIODEGRADABLE FLUIDS

Phosphate esters, organic esters, chlorinated hydrocarbons, water glycols, rapeseed may be pumped at high pressures and with long service life by these pumps.

GENERAL APPLICATIONS INSTRUCTIONS

1. Check speed range, pressure, temperature, fluid quality, fluid viscosity and pump rotation.
2. Check inlet conditions of the pump, if it can accept the application requirements.
3. Check the type of shaft : if it will support the operating torque.
4. Check the coupling must be chosen to minimize pump shaft load (weight, misalignment).
5. Filtration : must be adequate for the lowest contamination level.
6. Check the environment of the pump : as to avoid noise reflection, pollution and shocks.

¹⁾ Please consult Parker for application over 300 bar.

²⁾ Please be careful as these cartridge designation are now in ml/rev. (example : B22 = 22.5 ml/rev.)

³⁾ Please be sure that the inlet velocity is under 1.9 m/sec. (see page 12, start-up & check-up).

For further information, or if the performance characteristics outlined here above do not meet your particular requirements, please consult your local Parker office.

Inlet pressure is measured at inlet flange with petroleum base fluids at viscosity between 10 and 65 cSt. The difference between inlet pressure at the pump flange and atmospheric pressure must not exceed 0.2 bar to prevent aeration.

Multiply absolute pressure by 1.25 for HF-3, HF-4 fluids.

by 1.35 for HF-5 fluid.

by 1.10 for ester or rapeseed base.

For double and triple pumps, prefer the cartridge requiring the highest absolute pressure.

Inlet pressure is measured at inlet flange with petroleum base fluids at viscosity between 10 and 65 cSt. The difference between inlet pressure at the pump flange and atmospheric pressure must not exceed 0.2 bar to prevent aeration.

Multiply absolute pressure by 1.25 for HF-3, HF-4 fluids.

by 1.35 for HF-5 fluid.

by 1.10 for ester or rapeseed base.

For double and triple pumps, prefer the cartridge requiring the highest absolute pressure.

MAIN CALCULATION

To resolve
 Volumetric displ... V_i [ml/rev.]
 Available flow..... Q_{eff} [l/min]
 Input power..... P_{eff} [kW]

Performances required
 Requested flow Q [l/min] 42
 Speed..... n [RPM] 1500
 Pressure..... p [bar] 250

Routine :

Example :

1. First calculation $V_i = \frac{1000 Q}{n}$

$V_i = \frac{1000 \times 42}{1500} = 28 \text{ ml/rev.}$

2. Choice V_i of pump immediately greater (see tabulation)

T7B B10, $V_i = 31.8 \text{ cm}^3/\text{rev.}$

3. Theoretical flow of this pump

$Q_{theo} = \frac{V_i \times n}{1000}$

$Q_{theo} = \frac{31.8 \times 1500}{1000} = 47.7 \text{ l/min}$

4. Find qvs leakage function of pressure

$q_{Vs} = f(p)$ on curve at 10 or 24 cSt

T7B (page 22) : $q_{Vs} = 3 \text{ l/min at 250 bar, 24 cSt}$

5. Available flow $Q_{eff} = Q_{theo} - q_{Vs}$

$Q_{eff} = 47.7 - 3 = 44.7 \text{ l/min}$

6. Theoretical input power

$P_{theo} = \frac{Q_{theo} \times p}{600}$

$P_{theo} = \frac{47.7 \times 250}{600} = 19.9 \text{ kW}$

7. Find P_s hydrodynamic power loss on curve

T7B (page 22) : P_s at 1500 RPM, 250 bar = 1 kW

8. Calculation of necessary input power

$P_{eff} = P_{theo} + P_s$

$P = 19.9 + 1 = 20.9 \text{ kW}$

9. Results

$V_i = 31.8 \text{ ml/rev.}$
 $Q_{eff} = 47.7 \text{ l/min}$
 $P_{eff} = 20.9 \text{ kW}$ | T7B B10

These calculation steps must be followed for each application.

INTERMITTENT PRESSURE RATING

T7 and T67 units may be operated intermittently at pressures higher than the recommended continuous rating when the time weighted average of pressure is less than or equal to the continuous duty pressure rating. This intermittent pressure rating calculation is only valid when the other parameters : speed, fluid, viscosity and contamination level are respected.

For total cycle time longer than 15 minutes, please consult your Parker representative.

Example : T7B - B10

Duty cycle 4 min. at 320 bar
 1 min. at 35 bar
 5 min. at 160 bar

$\frac{(4 \times 320) + (1 \times 35) + (5 \times 160)}{10} = 211.5 \text{ bar}$

211.5 bar is lower than 290 bar allowed as continuous pressure for T7B - B10 with HF-0 fluid.

APPLICATION ADVANTAGES

- The high pressure capability up to 320 bar, in the small envelope, reduces installation costs and provides extended life at reduced pressure.
- The high volumetric efficiency, reduces heat generation, and allows speeds down to 600 RPM at full pressure.
- The high mechanical efficiency, typically better than 94%, reduces energy consumption.
- The wide speed range (600 RPM at 3600 RPM), combined with large size cartridge displacements will optimize operation for the lowest noise level in the smallest envelope.
- The low speed (600 RPM), low pressure, high viscosity (860 cSt) allows application in cold environment with a minimum energy consumption and without risk of seizure.
- The low ripple pressure (± 2 bar) reduces piping noise and increases lifetime of the other components in the circuit.
- The high resistance to particle contamination, thanks to the double lip technology increasing the pump lifetime.
- The large variety of options (cam displacement, shaft, porting) allows customized installation.
- Noise : Specially designed to optimize the low noise level characteristics.
- Cartridge concept : drops maintenance costs.

GENERAL :

All Parker vane pumps are individually tested to provide the best quality & reliability. Modifications, conversions & repairs can only be done by authorized dealers or OEM to avoid invalidation of the guarantee.

The pumps are to be used in the design limits indicated in all the sales bulletins. Please contact Parker when trespassing the catalogue limits.

Do not modify or work on the pump under pressure or when the electric motor (or any drive) is on.

Qualified personnel is required to assemble and set-up hydraulic devices.

Always conform yourself to the valid regulations (safety, electrical, environment...).

The following instructions are important to follow to obtain a good service life time from the unit.

ROTATION & PORTS INDICATION

The rotation and ports orientation are viewed from the shaft end.

CW stands for clockwise = right-hand rotation.

CCW stands for counter-clockwise = left-hand rotation.

START-UP CHECK-UP**Check that the assembly of the power unit is correct :**

The distance between the suction pipe & the return lines in the tank should be at its maximum.

A bevel on both suction & return lines is recommended to increase the surface and so lower the velocity. We suggest a 45° minimum angle.

Velocities : inlet $0.5 < x < 1.9$ m/s (1.64 < x < 6.23 ft per sec.)
: return $x < 6$ m/s (x < 19.7 ft per sec.)

: Always insure that all return and suction lines are under the oil level to avoid forming aeration or vortex effect. This should be done under the most critical situation (all cylinders extended for example). Straight and short pipes are the best.

$$V = \frac{Q \text{ (Lpm)}}{6 \times \pi \times r^2 \text{ (cm)}} = \text{m/s} \quad V = \frac{Q \text{ (GPM)}}{3.12 \times \pi \times r^2 \text{ (in)}} = \text{ft/s}$$

The size of the air filter should be 3 times greater than the max. instant return flow (all cylinders in movement for example).

If the pump is in the tank, please choose the NOP option (no paint) and use a short inlet pipe.

Parker does not recommend inlet strainers. If needed, a 100 mesh (149 microns) is the finest mesh recommended.

A coaxial drive is recommended. For any other type of drives, please contact Parker.

Make sure that all protective plugs & covers have been removed.

Check the pump rotation versus the E-motor or engine rotation.

Start-up :

The tank has been filled up with a clean fluid in proper conditions.

We recommend to flush the system with an external pump prior to the start-up.

It is important to bleed the air off the circuit & the pump itself.

The first valve on the circuit should be open to tank.

We recommend the use of air bleed off valves.

It is possible to bleed off the air by creating a leak in the P port of the pump. **Warning : this has to be done in a low pressure mode as it could create a dangerous fluid leak. Make sure that the pressure cannot rise (open center valve to tank, pressure relief valve unloaded ...).**

When oil free of air appears, tighten the connectors to the correct torque.

The pump should prime within a few seconds. If not, please consult our troubleshooting guide (document 1 - EN0721 - *).

If the pump is noisy, please troubleshoot the system.

Never operate the pump at top speed and pressure without checking the completion of pump priming.

SHAFT & COUPLING DATA :

COUPLINGS AND FEMALE SPLINES

- The mating female spline should be free to float and find its own center. If both members are rigidly supported, they must be aligned within 0.15 TIR (0.006" TIR) or less to reduce fretting. The angular alignment of two splines axes must be less than ± 0.05 per 25.4 radius (± 0.002 " per 1" radius).

- The coupling spline must be lubricated with a lithium molydisulfide grease, disulfide of molybdenum or a similar lubricant.

- The coupling must be hardened to a hardness between 29 and 45 HRC.

- The female spline must be made to conform to the Class 1 fit as described in SAE-J498b (1971). This is described as a Flat Root Side Fit.

Parker supplies the T7 series keyed shaft pumps with high strength heat-treated keys. Therefore, when installing or replacing these pumps, the heat-treated keys must be used in order to ensure maximum life in the application. If the key is replaced, it must be a heat-treated key between 27 and 34 R.C. hardness. The corners of the keys must be chamfered by 0.76 mm to 1.02 mm (0.03 to 0.04) at 45° to clear the radii in the key way.

The alignment of keyed shafts must be within tolerances given for splined shafts here above.

These products are primarily designed for coaxial drives which do not impose axial or side loading on the shaft. Contact Parker for specific applications.

KEYED SHAFTS

SHAFT LOADS

SPECIFIC POINTS :

MINIMUM INLET PRESSURE

Please read the charts in the sales leaflets as the minimum requested inlet pressure varies versus the displacement and the speed.

Never go under 0.8 bar Absolute (-0.2 bar relative)

11.6 PSI Absolute (-2.9 PSI G).

MAXIMUM INLET PRESSURE

It is recommended to always have at least 1.5 bar (22 PSI) differential between inlet and outlet.

Standard shaft seals are limited to 0.7 bar (10 PSI G) but some allow 7 bar (100 PSI G). Please contact Parker for more information.

MINIMUM OUTLET PRESSURE

It is recommended to always have at least 1.5 bar (22 PSI) differential between inlet and outlet.

VERTICAL MOUNT

When assembled vertically, always be careful to prevent any air from being trapped in the pump (behind the shaft seal for example).

FLUIDS :

DENISON CLASSIFICATION

Type of fluids : For each type of fluids, Parker vane pumps will have different pressures, speeds & temperature limits. Please refer to the sales leaflets.

HF-0 = Anti-wear petroleum base.

HF-1 = Non anti-wear petroleum base.

HF-2 = Anti-wear petroleum base.

HF-3 = Water-in-oil invert emulsions.

HF-4 = Water glycol solutions.

HF-5 = Synthetic fluids.

FILTRATION RECOMMENDATIONS

NAS 1638 class 8 or better.
ISO 19 / 17 / 14 or better.
Inlet strainer : Parker does not recommend inlet strainers.
If requested, a 100 mesh (149 microns) is the finest mesh recommended.

RECOMMENDED FLUIDS

Petroleum based antiwear R & O fluids.
These fluids are the recommended fluids for pumps & motors. Maximum catalogue (UK version) ratings and performance datas are based on operation with these fluids. These fluids are covered by Parker HF-0 and HF-2 specifications.

ACCEPTABLE ALTERNATE FLUIDS

The use of fluids other than petroleum based antiwear R & O fluids requires that the maximum ratings of the pumps will be reduced. In some cases the minimum replenishment pressures must be increased. Consult specific sections for more details.

VISCOSITY

	Industrial
Max. (cold start, low speed & pressure)	860 cSt - 3900 SUS
Max. (full speed & pressure)	108 cSt - 500 SUS
Optimum (max. life)	30 cSt - 140 SUS
Min. (full speed & pressure for HF-1, HF-3, HF-4 & HF-5 fluids)	18 cSt - 90 SUS
Min. (full speed & pressure for HF-0 & HF-2 fluids)	10 cSt - 60 SUS

VISCOSITY INDEX

90 min. Higher values extend the range of operating temperatures.

TEMPERATURES

The usual limiting factor of temperature (low or high) comes from the obtained viscosity. The seals are sometimes the limit : standard seals range from -30° C to 90° C (-9.4° F to 194° F).

Maximum fluid temperature (θ)	° C	° F
HF-0, HF-1, HF-2	+ 100	+ 212
HF-3, HF-4	+ 50	+ 122
HF-5	+ 70	+ 158
Biodegradable fluids (esters & rapeseed base)	+ 65	+ 149
Minimum fluid temperature (θ)	° C	° F
(also depend on max. viscosity)		
HF-0, HF-1, HF-2, HF-5	- 18	- 0.4
HF-3, HF-4	+ 10	+ 50
Biodegradable fluids (esters & rapeseed base)	- 18	- 0.4

Over or under these values, please contact Parker.

WATER CONTAMINATION IN THE FLUID

Maximum acceptable content of water :

- 0.10 % for mineral base fluids.
 - 0.05 % for synthetic fluids, crankcase oils, biodegradable fluids.
- If the amount of water is higher, then it must be drained off the circuit.

FLUID POWER FORMULAS

Pump input torque	N.m	$\frac{\text{pressure (bar)} \times \text{displacement cm}^3/\text{rev}}{20 \pi \times \text{mech. eff.}}$
Pump input power	kW	$\frac{\text{rpm} \times (\text{cm}^3/\text{rev}) \times \text{pressure (bar)}}{600000 \times \text{overall eff.}}$

Direction of rotation (shaft end view)
 R = Clockwise
 L = Counter-clockwise

INTERNAL LEAKAGE (TYPICAL)

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow.
 Total leakage is the sum of each section loss under its respective operating conditions.

NOISE LEVEL (TYPICAL) - T67CB - 014 - B03

Double pump noise level is given with both stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

PERMISSIBLE RADIAL LOAD

Maximum permissible axial load Fa = 800 N

INTERNAL LEAKAGE (TYPICAL)

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow.
 Total leakage is the sum of each section loss under its respective operating conditions.

NOISE LEVEL (TYPICAL) - T67EC - 050 - 022

Double pump noise level is given with both stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

INTERNAL LEAKAGE (TYPICAL)

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow.
 Total leakage is the sum of each section loss under its respective operating conditions.

NOISE LEVEL (TYPICAL) - T7DBB - B38 - B06 - B04

Triple pump noise level is given with all stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

PERMISSIBLE RADIAL LOAD

Maximum permissible axial load $F_a = 1200\text{ N}$

INTERNAL LEAKAGE (TYPICAL)

NOISE LEVEL (TYPICAL) - T7DDB - B31 - B10

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow. Total leakage is the sum of each section loss under its respective operating conditions.

Triple pump noise level is given with all stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

PERMISSIBLE RADIAL LOAD

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

Maximum permissible axial load $F_a = 1200\text{ N}$

* We do not recommend to use the size 003 in P3 at 275 bar & 1500 RPM as the internal leakage is over 50% of theoretical flow.

¹⁾ 050 - 028 - 031 = 210 bar max. int.

²⁾ 085 = 90 bar max. int.

³⁾ 045 = 240 bar max. int.

INTERNAL LEAKAGE (TYPICAL)

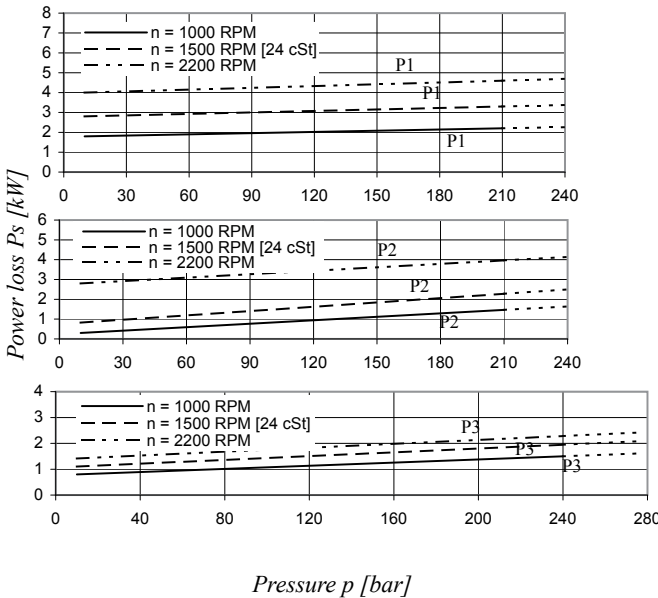

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow.
 Total leakage is the sum of each section loss under its respective operating conditions.

NOISE LEVEL (TYPICAL) - T67EDCS - 062 - B35 - 022

Triple pump noise level is given with all stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

PERMISSIBLE RADIAL LOAD

Maximum permissible axial load $F_a = 2000\text{ N}$

INTERNAL LEAKAGE (TYPICAL)

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is higher than 50% of theoretical flow. Total leakage is the sum of each section loss under its respective operating conditions.

NOISE LEVEL (TYPICAL) - T7EECS - 052 - 052 - 025

Triple pump noise level is given with all stages discharging at the pressure value indicated on the curve.

POWER LOSS HYDROMECHANICAL (TYPICAL)

Total hydromechanical power loss is the sum of each section loss under its respective operating conditions.

PERMISSIBLE RADIAL LOAD

Maximum permissible axial load $F_a = 2000\text{ N}$

Model No. **T7EEC or T7EECS - 062 - 062 - 017 - 2 R 00 - A 1 - M0 - ..**

T7EEC series - 250-B4-HW
 ISO 4 bolts 3019-2 mounting flange

T7EECS series - SAE E 4 bolts
 J744 mounting flange

Displacement for "P1" & "P2"

Volumetric displacement (ml/rev)
 042 = 132.3 057 = 183.3
 045 = 142.4 062 = 196.7
 050 = 158.5 066 = 213.3
 052 = 164.8 072 = 227.1
 054 = 171.0 085 = 268.7

Displacement for "P3"

Volumetric displacement (ml/rev.)
 003 = 10.8 017 = 58.3
 005 = 17.2 020 = 63.8
 006 = 21.3 022 = 70.3
 008 = 26.4 025 = 79.3
 010 = 34.1 028 = 88.8
 012 = 37.1 031 = 100.0
 014 = 46.0

Modifications
